### 2J FlowModelsBuilding

- Maximum/Minimum flow with lower bound / Circulation problem
  - 1. Construct super source S and sink T.
  - 2. For each edge (x,y,l,u), connect  $x\to y$  with capacity u-l. 3. For each vertex v, denote by in(v) the difference between the sum of incoming lower bounds and the sum of outgoing lower bounds.
  - 4. If in(v)>0, connect  $S\to v$  with capacity in(v), otherwise, connect  $v\to T$  with capacity -in(v).
    - To maximize, connect t 
      ightarrow s with capacity  $\infty$  (skip this in circulation problem), and let f be the maximum flow from S to T. If  $f 
      eq \sum_{v \in V, in(v) > 0} in(v)$ , there's no solution. Otherwise, the maximum flow from s to t is the answer.
    - To minimize, let f be the maximum flow from S to T. Connect  $t \to s$  with capacity  $\infty$  and let the flow from S to T be f'. If  $f+f' \neq \sum_{v \in V, in(v)>0} in(v)$ , there's no solution. Otherwise, f' is the answer.
  - 5. The solution of each edge e is  $l_e + f_e$ , where  $f_e$ corresponds to the flow of edge e on the graph.
- ullet Construct minimum vertex cover from maximum matching Mon bipartite graph (X,Y)
  - 1. Redirect every edge:  $y \rightarrow x$  if  $(x,y) \in M$ ,  $x \rightarrow y$  otherwise.
  - 2. DFS from unmatched vertices in X.
  - 3.  $x \in X$  is chosen iff x is unvisited. 4.  $y \in Y$  is chosen iff y is visited.
- Minimum cost cyclic flow
  - 1. Consruct super source S and sink T
- 2. For each edge (x,y,c), connect  $x \to y$  with (cost,cap) = (c,1)if c>0, otherwise connect  $y\to x$  with (cost, cap)=(-c,1)

- 3. For each edge with c < 0, sum these cost as K, then increase d(y) by 1, decrease d(x) by 1
- 4. For each vertex v with d(v)>0, connect  $S \to v$  with (cost, cap) = (0, d(v))
- 5. For each vertex v with d(v) < 0, connect v o T with (cost, cap) = (0, -d(v))
- 6. Flow from S to T, the answer is the cost of the flow  $C\!+\!K$
- · Maximum density induced subgraph
  - 1. Binary search on answer, suppose we're checking answer T
  - 2. Construct a max flow model, let K be the sum of all weights

  - 3. Connect source  $s \to v$ ,  $v \in G$  with capacity K4. For each edge (u,v,w) in G, connect  $u \to v$  and  $v \to u$  with capacity w
  - 5. For  $v \in G$ , connect it with sink  $v \to t$  with capacity  $K+2T-(\sum_{e \in E(v)} w(e))-2w(v)$
  - 6. T is a valid answer if the maximum flow f < K|V|
- Minimum weight edge cover
  - 1. For each  $v \in V$  create a copy v', and connect  $u' \to v'$ with weight w(u,v).
  - 2. Connect  $v \rightarrow v'$  with weight  $2\mu(v)$ , where  $\mu(v)$  is the cost of the cheapest edge incident to v.
  - 3. Find the minimum weight perfect matching on  $G^{\prime}$ .
- Project selection problem
  - 1. If  $p_v > 0$ , create edge (s,v) with capacity  $p_v$ ; otherwise, create edge (v,t) with capacity  $-p_v$  .
  - 2. Create edge (u,v) with capacity w with w being the cost of choosing  $\boldsymbol{u}$  without choosing  $\boldsymbol{v}$ .
  - 3. The mincut is equivalent to the maximum profit of a subset of projects.
- Dual of minimum cost maximum flow
  - 1. Capacity  $c_{uv}$ , Flow  $f_{uv}$ , Cost  $w_{uv}$ , Required Flow difference for vertex  $b_u$ .
  - 2. If all  $w_{uv}$  are integers, then optimal solution can happen when all  $p_u$  are integers.

$$\begin{split} \min & \sum_{uv} w_{uv} f_{uv} \\ & -f_{uv} \geq -c_{uv} \Leftrightarrow \min \sum_{u} b_{u} p_{u} + \sum_{uv} c_{uv} \max(0, p_{v} - p_{u} - w_{uv}) \\ & \sum_{v} f_{vu} - \sum_{v} f_{uv} = -b_{u} \end{split}$$

#### 5M Theorems

· Cramer's Rule

Vandermonde's Identity

$$C(n\!+\!m,\!k)\!=\!\sum_{i=0}^k\!C(n,\!i)C(m,\!k\!-\!i)$$

Denote L be a  $n \times n$  matrix as the Laplacian matrix of graph G, where  $L_{ii}\!=\!d(i)$ ,  $L_{ij}\!=\!-c$  where c is the number of edge (i,j) in G.

- The number of undirected spanning in G is  $|\det(\ddot{L}_{11})|$  .
- The number of directed spanning tree rooted at r in G is  $|\det(\tilde{L}_{rr})|$ .

#### Tutte's Matrix

Let D be a  $n \times n$  matrix, where  $d_{ij} = x_{ij}$  ( $x_{ij}$  is chosen uniformly at random) if i < j and  $(i,j) \in E$ , otherwise  $d_{ij} = -d_{ji}$ .  $\frac{rank(D)}{2}$  is the maximum matching on G.

- Cayley's Formula
  - Given a degree sequence  $d_1,d_2,...,d_n$  for each labeled vertices, there are  $\frac{(n-2)!}{(d_1-1)!(d_2-1)!\cdots(d_n-1)!}$  spanning trees.
  - Let  $T_{n,k}$  be the number of labeled forests on n vertices with k components, such that vertex  $1,2,\ldots,k$  belong to different components. Then  $T_{n,k}=kn^{n-k-1}$  .

#### Erdős-Gallai Theorem

A sequence of nonnegative integers  $d_1 \geq \cdots \geq d_n$  can be represented as the degree sequence of a finite simple graph on n vertices if and only if  $d_1+\cdots+d_n$  is even and

$$\sum_{i=1}^k\!d_i\!\leq\!k(k-1)+\sum_{i=k+1}^n\!\min(d_i,\!k) \text{ holds for every } 1\!\leq\!k\!\leq\!n\text{.}$$

#### Gale-Ryser Theorem

A pair of sequences of nonnegative integers  $a_1 \geq \cdots \geq a_n$  and  $b_1,\ldots,b_n$  is bigraphic (degree seqence of bipartie

graph) if and only if 
$$\sum_{i=1}^n a_i = \sum_{i=1}^n b_i$$
 and  $\sum_{i=1}^k a_i \leq \sum_{i=1}^n \min(b_i,k)$ 

holds for every  $1 \le k \le n$ 

### Fulkerson-Chen-Anstee Theorem

A sequence  $(a_1,b_1),...,(a_n,b_n)$  of nonnegative integer pairs with  $a_1\geq \cdots \geq a_n$  is digraphic (in, out degree of a di-

rected graph) if and only if 
$$\sum_{i=1}^n a_i = \sum_{i=1}^n b_i$$
 and  $\sum_{i=1}^k a_i \leq a_i$ 

- Möbius Inversion Formula
  - $f(n) = \sum_{d|n} g(d) \Leftrightarrow g(n) = \sum_{d|n} \mu(d) f(\frac{n}{d})$
  - $f(n) = \sum_{n|d} g(d) \Leftrightarrow g(n) = \sum_{n|d} \mu(\frac{d}{n}) f(d)$

#### · Lagrange Multiplier

- Optimize  $f(x_1,...,x_n)$  when k constraints  $g_i(x_1,...,x_n)\!=\!0$  .
- Lagrangian  $\ \ \ \ \mathcal{L}(x_1,\ \dots\ ,\ x_n,\ \lambda_1,\ \dots\ ,\ \lambda_k) =$  $f(x_1,...,x_n)-\sum_{i=1}^k\lambda_ig_i(x_1,...,x_n)$ . The solution corresponding to the original con-
- strained optimization is always a saddle point of the Lagrangian function.

Given F(x) where

$$F(x) = \sum_{i=0}^{\infty} \alpha_i (x - \beta)^i$$

for  $\beta$  being some constant. Polynomial P such that  $F(P)\,=\,0$  can be found iteratively. Denote by  $Q_k$  the polynomial such that  $F(Q_k) = 0 \pmod{x^{2^k}}$ , then

· Pick's theorem

For simple integer-coordinate polygon,

$$A = \mathsf{B} + \frac{I}{2} - 1$$

Where A is the area; B,I is #lattice points in the interior, on the boundary.

· Spherical Cap

- A portion of a sphere cut off by a plane.
  r: sphere radius, a: radius of the base of the cap, h: height of the cap,  $\theta$ : arcsin(a/r).
- Volume =  $\pi h^2 (3r h)/3 = \pi h (3a^2 + h^2)/6 = \pi r^3 (2 + \cos\theta) (1 \cos\theta)^2/3$ .
- Area  $= 2\pi rh = \pi(a^2 + \acute{h^2}) = 2\pi r^2(1-\cos\theta)$ .

 9C MoAlgoAdvanced
 • Mo's Algorithm With Addition Only
    - Sort querys same as the normal Mo's algorithm.
    - For each query [l,r]:
    - If l/blk = r/blk, brute-force.
    - If l/blk \neq curL/blk, initialize curL := (l/blk+1) \cdot blk, curR :=
      curL\!-\!1
    - If r > curR, increase curR
    - decrease \dot{cur}L to fit l, and then undo after answering
 • Mo's Algorithm With Offline Second Time
     · Require: Changing answer \equiv adding f([l,r],r+1).
    - Require: f([l,r],r+1) = f([1,r],r+1) - f([1,l),r+1).
    - Part1: Answer all f([1,r],r+1) first.
    - Part2: Store curR \rightarrow R for curL (reduce the space to
              and then answer them by the second offline
      algorithm.
    - Note: You must do the above symmetrically for the
      left boundaries.
